Technical report: assessment of the impact of the coronavirus (COVID-19) pandemic on the FRS statistics, 2020 to 2021

Summary of the coronavirus (COVID-19) pandemic related changes on the 2020 to 2021 FRS statistics

Change

While it is not possible to quantify the impact each of these factors had on the FRS statistics,

had the same resultant weight as those sampled in any other month. It was important to make this adjustment because during 2020

year. The exact difference will vary from estimate to estimate. We would encourage users to refer to published standard error tables where appropriate.

For examples of other publications detailing changes in household circumstances and incomes, please see the following:

- the Office for National Statistics' Personal and economic well-being in Great Britain: May 2021
- Understanding Society's research paper A year of COVID: the evolution of labour market and financial inequalities through the crisis

The FRS asks respondents about receipt of the full range of state benefits, and amounts received, including Universal Credit. There is a known undercount for a number of these benefits, which means that when grossed to population totals, the FRS still estimates that there are fewer receiving the benefits than is reported

single-

It should also be appreciated that the statistics for 2020 to 2021 suggest a material decrease in the number of self-employed people when compared to recent years. This may have affected the earnings estimates being presented. Overall, the FRS estimates point to a significant reduction in real terms self-employed net earnings over1 (gni)0.9 (he c)-1 (our)-3 (s)-1 (e of)]TJ0 Tc 0 Tw 8.01 0 Td( )T

Figure 3: Change in the FRS disabled population by impairment 2018-19 to 2020-21

Closer examination of the under- and over-representation by impairment type revealed that it affected both working-age and pensioner disability groups. We also concluded that the composition of the disabled FRS
