List of Variables in the FRS Resamples Datasets

Process of Measuring Uncertainty in FRS Estimates

1. Join any FRS data on FRS main tables for which an estimate is desired with the resamples dataset containing all resample grossing factors.
2. Calculate the relevant FRS estimate many times.
   a) Firstly, calculate the ‘Central Estimate’ using full sample grossing factors (i.e. Gross4)
   b) Then calculate all ‘Resample Estimates’ using the resample grossing factors: (i.e. gs_indpp1 to gs_indpp500).
3. For 95% confidence intervals, order the resample estimates by ascending values: e.g. from lowest value (rank=1) to highest value (rank=500).
4.
